 r_4 

$$\hat{y} = \sum_i r_i a_i$$

$$a_i = m_i / \sum_j m_j$$

equal — not learned

$$r_i = \tanh(\mathbf{W}_{r,i}^T \mathbf{x}_i)$$

present = 1, absent = 0

Same head r_i and output as A/B, but attention degenerates to $1/\sum m$ (equal division over available modalities); a missing modality ($m_i = 0$) drops out automatically. Illustrated for $N = 4$; supports up to $N = 6$.
